File Navigation and I/O

3

1Z0-809 Chapter 5

Overview of I/O Classes

- Here's a summary of the I/O classes you'll need to understand for the exam:

- **File**
- **FileReader**
- **BufferedReader**
- **FileWriter**
- **BufferedWriter**
- **PrintWriter**
- **FileInputStream**
- **FileOutputStream**
- **ObjectInputStream**
- **ObjectOutputStream**
- **Console**

M. Romdhani, 2020

4

2

1Z0-809 Chapter 5

Creating Files Using the File Class

- Objects of type **File** are used to represent the actual files (but not the data in the files) or directories that exist on a computer's physical disk.

- Example:

```
import java.io.*;
class Writer1 {
    public static void main(String [] args) {
        try {
            boolean newFile = false; // warning: exceptions possible
            File file = new File ("fileWrite1.txt");
            System.out.println(file.exists()); // look for a real file
            newFile = file.createNewFile(); // maybe create a file!
            System.out.println(newFile); // already there?
            System.out.println(file.exists()); // look again
        } catch(IOException e) { }
    }
}
```

- This produces the output: **false, true, true**
- And also produces an empty file in your current directory. If you run the code a second time, you get the output : **true, false, true**

M. Romdhani, 2020

1Z0-809 Chapter 5

Using FileInputStream and FileOutputStream

- Using **FileInputStream** and **FileOutputStream** is similar to using **FileReader** and **FileWriter**, except you're working with **byte data instead of character data**.

- That means you can use **FileInputStream** and **FileOutputStream** to read and write binary data as well as text data.

- Example

```
import java.io.*;
class Writer3 {
    public static void main(String [] args) {
        byte[] in = new byte[50]; // bytes, not chars!
        int size = 0;
        FileOutputStream fos = null;
        FileInputStream fis = null;
        File file = new File("fileWrite3.txt");
        try {
            fos = new FileOutputStream(file); // create a FileOutputStream
            String s = "howdy\\nfolks\\n";
            fos.write(s.getBytes("UTF-8")); // write characters (bytes)
                                         // to the file
            fos.flush(); // flush before closing
            fos.close(); // close file when done
        }
        fis = new FileInputStream(file); // create a FileInputStream
        size = fis.read(in); // read the file into in
        System.out.print(size + " "); // how many bytes read
        for(byte b : in) { // print the array
            System.out.print((char)b);
        }
        fis.close(); // again, always close
    } catch(IOException e) {
        e.printStackTrace();
    }
}
```

java.io Mini API

java.io Class	Extends From	Key Constructor(s) Arguments	Key Methods
File	Object	File, String String String, String	createNewFile() delete() exists() isDirectory() isFile() list() mkdir() renameTo()
FileWriter	Writer	File String	close() flush() write()
BufferedWriter	Writer	Writer	close() flush() newLine() write()
PrintWriter	Writer	File (as of Java 5) String (as of Java 5) OutputStream Writer	close() flush() format(), printf() print(), println() write()
FileOutputStream	OutputStream	File String	close() write()
FileReader	Reader	File String	read()
BufferedReader	Reader	Reader	read() readLine()
FileInputStream	InputStream	File String	read() close()

7

1Z0-809 Chapter 5

The java.io.Console Class

- Java 6 added the `java.io.Console` class. In this context, the `console` is the physical device with a keyboard and a display (like your Mac or PC).

- Let's take a look at a small program that uses a console to support testing another class:

```
import java.io.Console;

public class NewConsole {
    public static void main(String[] args) {
        String name = "";
        Console c = System.console();           // #1: get a Console
        char[] pw;                            // #2: return a char[]
        pw = c.readPassword("%s", "pw: ");
        for(char ch: pw)
            c.format("%c ", ch);             // #3: format output
        c.format("\n");

        MyUtility mu = new MyUtility();
        while(true) {
            name = c.readLine("%s", "input?: "); // #4: return a String
            c.format("output: %s \n", mu.doStuff(name));
        }
    }
}
```

Files, Path, and Paths

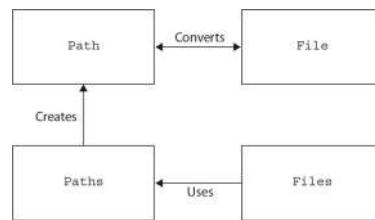

9

Java File I/O (NIO.2)

1Z0-809 Chapter 5

- The term **NIO.2** is a bit loosely defined, but most people (and the exam creators) define NIO.2 as being the key new features introduced in Java 7 that reside in two packages:
 - `java.nio.file`
 - `java.nio.file.attribute`
- NIO.2 adds three new central classes that you'll need to understand well for the exam:
 - **Path** This interface replaces File as the representation of a file or a directory when working in NIO.2. It is a lot more powerful than a File.
 - **Paths** This class contains static methods that create Path objects.
 - **Files** This class contains static methods that work with Path objects. You'll find basic operations in here like copying or deleting files.
- Let's take a look at these relationships another way.
 - The Paths class is used to create a class implementing the Path interface.
 - The Files class uses Path objects as parameters.

M. Romdhani, 2020

10

10

1Z0-809 Chapter 5

Creating/Normalizing a Path

- A Path object can be easily created by using the get methods from the Paths helper class.

- Remember you are calling `Paths.get()` and not `Path.get()`

```
Path p1 = Paths.get("/tmp/file1.txt"); // on UNIX
Path p2 = Paths.get("c:\\temp\\test"); // On Windows
```

- `Paths.get(URI uri)` lets you (indirectly) convert the String to a URI (Uniform Resource Identifier) before trying to create a Path:

```
Path p = Paths.get(URI.create("file:///C:/temp"));
```

- Normalize() simplifies path representation

```
System.out.println(Paths.get("/a/../b/./c").normalize());
System.out.println(Paths.get(".classpath").normalize());
System.out.println(Paths.get("/a/b/c/..").normalize());
System.out.println(Paths.get("../a/b/c").normalize());
```

- This outputs:

```
/a/b/c
.classpath
/a/b
../a/b/c
```

M. Romdhani, 2020

11

11

1Z0-809 Chapter 5

Resolving/relativizing a Path

- If you need to combine two paths, `Resolve` is to the rescue:

```
Path dir = Paths.get("/home/java");
Path file = Paths.get("models/Model.pdf");
Path result = dir.resolve(file);
System.out.println("result = " + result);
```

This produces the absolute path by merging the two paths:

```
result = /home/java/models/Model.pdf
```

- Relativizing a Path

- We have the absolute path of our home directory and the absolute path of the music file in our home directory. We want to know just the music file directory and name.

```
Path dir = Paths.get("/home/java");
Path music = Paths.get("/home/java/country/Swift.mp3");
Path mp3 = dir.relativize(music);
System.out.println(mp3);
```

- This outputs :

```
country/Swift.mp3 .
```

M. Romdhani, 2020

12

12

1Z0-809 Chapter 5

I/O vs. NIO.2 Permissions

Description	I/O Approach	NIO.2 Approach
Get the last modified date/time	File file = new File("test"); file.lastModified();	Path path = Paths.get("test"); Files.getLastModifiedTime(path);
Is read permission set	File file = new File("test"); file.canRead();	Path path = Paths.get("test"); Files.isReadable(path);
Is write permission set	File file = new File("test"); file.canWrite();	Path path = Paths.get("test"); Files.isWritable(path);
Is executable permission set	File file = new File("test"); file.canExecute();	Path path = Paths.get("test"); Files.isExecutable(path);
Set the last modified date/time (Note: timeInMillis is an appropriate long)	File file = new File("test"); file.setLastModified(timeInMillis);	Path path = Paths.get("test"); FileTime fileTime = FileTime. fromMillis(timeInMillis); Files.setLastModifiedTime(path, fileTime);

M. Romdhani, 2020

13

13

1Z0-809 Chapter 5

DirectoryStream

- You might need to loop through a directory. Let's say you were asked to list out all the users with a home directory on this computer.

```
/home
| - users
|   | - vafi
|   | - eyra

Path dir = Paths.get("/home/users");
try (DirectoryStream<Path> stream = Files.newDirectoryStream(dir)) {           // use try-with-resources
    for (Path path : stream)           // so we don't have close()
        System.out.println(path.getFileName());
}
■ As expected, this outputs      vafi
                                eyra
```

- We only want the home directories of users whose names begin with either the letter v or the letter w.

```
Path dir = Paths.get("/home/users");
try (DirectoryStream<Path> stream = Files.newDirectoryStream(
    dir, "[vw]*")) {           // "v" or "w" followed by anything
    for (Path path : stream)
        System.out.println(path.getFileName());
}
■ This outputs: vafi
```

M. Romdhani, 2020

14

14

Serialization

15

What is Serialization ?

IZO-809 Chapter 5

- Serialization lets you simply say “**save this object and all of its instance variables**” unless it is explicitly marked a variable as transient.

- Working with **ObjectOutputStream** and **ObjectInputStream**

- Here's a small program that creates a Cat object, serializes it, and then deserializes it:

```

ObjectOutputStream.writeObject() // serialize and write
ObjectInputStream.readObject() // read and deserialize

import java.io.*;

class Cat implements Serializable {} // 1

public class SerializeCat {
    public static void main(String[] args) {
        Cat c = new Cat(); // 2
        try {
            FileOutputStream fs = new FileOutputStream("testSer.ser");
            ObjectOutputStream os = new ObjectOutputStream(fs);
            os.writeObject(c); // 3
            os.close();
        } catch (Exception e) { e.printStackTrace(); }

        try {
            FileInputStream fis = new FileInputStream("testSer.ser");
            ObjectInputStream ois = new ObjectInputStream(fis);
            c = (Cat) ois.readObject(); // 4
            ois.close();
        } catch (Exception e) { e.printStackTrace(); }
    }
}

```

M. Romdhani, 2020

16

Serializing Object Graphs

- You do have to make a conscious choice to create objects that are **Serializable** by implementing the **Serializable** interface

M. Romdhani, 2020

1Z0-809 Chapter 5

```

import java.io.*;
public class SerializeDog {
    public static void main(String[] args) {
        Collar c = new Collar(3);
        Dog d = new Dog(c, 5);
        System.out.println("before: collar size is "
            + d.getCollar().getCollarSize());
        try {
            FileOutputStream fs = new FileOutputStream("testSer.ser");
            ObjectOutputStream os = new ObjectOutputStream(fs);
            os.writeObject(d);
            os.close();
        } catch (Exception e) { e.printStackTrace(); }
        try {
            FileInputStream fis = new FileInputStream("testSer.ser");
            ObjectInputStream ois = new ObjectInputStream(fis);
            d = (Dog) ois.readObject();
            ois.close();
        } catch (Exception e) { e.printStackTrace(); }

        System.out.println("after: collar size is "
            + d.getCollar().getCollarSize());
    }
}
class Dog implements Serializable {
    private Collar theCollar;
    private int dogSize;
    public Dog(Collar collar, int size) {
        theCollar = collar;
        dogSize = size;
    }
    public Collar getCollar() { return theCollar; }
}
class Collar implements Serializable {
    private int collarSize;
    public Collar(int size) { collarSize = size; }
    public int getCollarSize() { return collarSize; }
}

```

17

17

How Inheritance affects Serialization ?

- If a superclass is **Serializable**, then, according to normal Java interface rules, all subclasses of that class automatically implement **Serializable** implicitly.
- What happens if a superclass is not marked **Serializable**, but the subclass is?

```

class Animal {
    public String name;
}
class Dog extends Animal implements Serializable {
    // the rest of the Dog code
}

```

- Because **Animal** is not **Serializable**, **any state maintained in the Animal class, even though the state variable is inherited by the Dog, isn't going to be restored with the Dog when it's deserialized!** The reason is, the (unserialized) **Animal** part of the **Dog** is going to be reinitialized, just as it would be if you were making a new **Dog** (as opposed to deserializing one).

M. Romdhani, 2020

1Z0-809 Chapter 5

18

18

1Z0-809 Chapter 5

Serialization Is Not for Statics

- Should static variables be saved as part of the object's state?
 - Isn't the state of a static variable at the time an object was serialized important? Yes and no.
 - It might be important, but **it isn't part of the instance's state at all.**
- Static variables are *never* saved as part of the object's state...because they do not belong to the object!

M. Romdhani, 2020
